Reach all screens in an emergency - from your smartphone

How the ScreenWay mobile app sends a message to every screen in the building in seconds

1 June 2026, Tobias Engl

With the ScreenWay Mobile app, a message can be sent from a smartphone to all of the company's networked screens in an emergency. You open the app, select the type of message and its urgency, write a short text and specify which screens should display it. A few seconds later, the message appears on each selected display. In a hotel, for example, on all screens, from the entrance to the fitness room.

There is a choice of different categories for messages and urgency levels; the display duration can also be specified. A message can be sent to all screens simultaneously or only to individual screens, such as those on the first floor. All of this is done directly on the smartphone, without a computer and without complicated registration. In an emergency, speed is of the essence and the seconds between recognizing a situation and the moment the appropriate information appears on the screen. This is exactly what the app is designed for. It is available for iOS and Android, which is why hotels, event organizers and public buildings use it as an additional way to reach their guests quickly at all times.
