Theory in Every Language

How AI-Powered Displays in Driving Schools and in Front of Simulators Help With Practice

13 October 2026, Tobias Engl

Getting a driver's license involves a lot of theory, and not everyone learns it in the same language or at the same pace. At driving school and in front of the simulators, a screen takes over part of this work patiently and as often as necessary.

This demonstrates what local artificial intelligence can do in everyday life. A theoretical question can be read aloud, explained in another language, and illustrated with an example if the text alone isn't enough. If you don't recognize a sign, it will be named for you; if you've misunderstood a rule, you'll receive a second explanation.

In front of the simulators, the display manages both operations and training. It shows which device is available and who is next in line, and it lists the exercise of the day. After the drive, it summarizes what to look out for without offering a judgment as a guide for the next round.

ScreenWay lets this AI perform its calculations on-site, right at the driving school itself. Translation, voice-over, and explanations all take place within the device, without the need for the cloud. This way, the students' data stays in-house, and the driving instructor retains the role that only he can fulfill: that of the person who teaches.

You pass an exam on your own, but the journey to that point becomes easier when the material is accessible in your own language and at your own pace. That's exactly what a screen that thinks along with you without being intrusive provides.
